BX50M-TAP GNSS RTK Board

Overview

The BX50M-TAP adopts Tersus Antares Chip, and provides real-time monitoring of interference signals and automatic filtering. It tracks all current GNSS constellations including GPS, GLONASS, Galileo, BeiDou, QZSS, SBAS, and IRNSS to improve continuity and reliability of RTK solutions that provide centimeter positioning.

The BX50M-TAP includes TAP, the satellite-based precise point positioning service developed by Tersus GNSS. With TAP, the GNSS rover receiver will not need to work with the local RTK base station or CORS, but directly receives corrections broadcast by the satellites, such as ephemeris error, satellite clock error, etc.

It has a small size, low power consumption, flexible interface, intelligent hardware design, and a common log/command format for easy integration.
